NOTIFICATION CONCERNING SUBMISSION OR TRANSMITTAL OF PRIORITY DOCUMENT

(PCT Administrative Instructions, Section 411)

VESTAS WIND SYSTEM A/S et al

CHAS. HUDE A/S 33, H.C. Andersens Boulevard DK-1780 Copenhagen V DANEMARK

O8 November 2000 (08.11.00)			
Applicant's or agent's file reference 72646 Si/Ve	IMPORTANT NOTIFICATION		
International application No. PCT/DK00/00558	International filing date (day/month/year) 05 October 2000 (05.10.00)		
International publication date (day/month/year) Not yet published	Priority date (day/month/year) 07 October 1999 (07.10.99)		
Applicant			

- The applicant is hereby notified of the date of receipt (except where the letters "NR" appear in the right-hand column) by the International Bureau of the priority document(s) relating to the earlier application(s) indicated below. Unless otherwise indicated by an asterisk appearing next to a date of receipt, or by the letters "NR", in the right-hand column, the priority document concerned was submitted or transmitted to the international Bureau in compliance with Rule 17.1(a) or (b).
- 2. This updates and replaces any previously issued notification concerning submission or transmittal of priority documents.
- An asterisk(*) appearing next to a date of receipt, in the right-hand column, denotes a priority document submitted or transmitted to the International Bureau but not in compliance with Rule 17.1(a) or (b). In such a case, the attention of the applicant is directed to Rule 17.1(c) which provides that no designated Office may disregard the priority claim concerned before giving the applicant an opportunity, upon entry into the national phase, to furnish the priority document within a time limit which is reasonable under the circumstances.
- The letters "NR" appearing in the right-hand column denote a priority document which was not received by the International Bureau or which the applicant did not request the receiving Office to prepare and transmit to the international Bureau, as provided by Rule 17.1(a) or (b), respectively. In such a case, the attention of the applicant is directed to Rule 17.1(c) which provides that no designated Office may disregard the priority claim concerned before giving the applicant an opportunity, upon entry into the national phase, to furnish the priority document within a time limit which is reasonable under the circumstances.

PCT NOTICE INFORMING THE APPLICANT OF THE COMMUNICATION OF THE INTERNATIONAL APPLICATION TO THE DESIGNATED OFFICES (PCT Rule 47.1(c), first sentence) Date of mailing (day/month/year) 12 April 2001 (12.04.01)		· -	ersens Boule enhagen V agstype J.nr. 1917 726	llna.	
Applicant's or agent's file reference 72646 Si/Ve		MPORTANT	NOTICE	-	
		ate (day/month/year) 000 (05.10.00)	1	day/month/year) ober 1999 (07.10.9	9)
Applicant	<u> </u>		_1		

Notice is hereby given that the International Bureau has communicated, as provided in Article 20, the international application to the following designated Offices on the date indicated above as the date of mailing of this Notice: AU, KP, KR, US

In accordance with Rule 47.1(c), third sentence, those Offices will accept the present Notice as conclusive evidence that the communication of the international application has duly taken place on the date of mailing indicated above and no copy of the international application is required to be furnished by the applicant to the designated Office(s).

2. The following designated Offices have waived the requirement for such a communication at this time:

AE,AG,AL,AM,AP,AT,AZ,BA,BB,BG,BR,BY,BZ,CA,CH,CN,CR,CU,CZ,DE,DK,DM,DZ,EA,EE,EP,ES, FI,GB,GD,GE,GH,GM,HR,HU,ID,IL,IN,IS,JP,KE,KG,KZ,LC,LK,LR,LS,LT,LU,LV,MA,MD,MG,MK, MN,MW,MX,MZ,NO,NZ,OA,PL,PT,RO,RU,SD,SE,SG,SI,SK,SL,TJ,TM,TR,TT,TZ,UA,UG,UZ,VN,YU, The communication will be made to those Offices only upon their request. Furthermore, those Offices do not require the applicant to furnish a copy of the international application (Rule 49.1(a-bis)).

3. Enclosed with this Notice is a copy of the international application as published by the International Bureau on 12 April 2001 (12.04.01) under No. WO 01/25628

REMINDER REGARDING CHAPTER II (Article 31(2)(a) and Rule 54.2)

If the applicant wishes to postpone entry into the national phase until 30 months (or later in some Offices) from the priority date, a demand for international preliminary examination must be filed with the competent International Preliminary Examining Authority before the expiration of 19 months from the priority date.

It is the applicant's sole responsibility to monitor the 19-month time limit.

VESTAS WIND SYSTEM A/S et al

Note that only an applicant who is a national or resident of a PCT Contracting State which is bound by Chapter II has the right to file a demand for international preliminary examination.

REMINDER REGARDING ENTRY INTO THE NATIONAL PHASE (Article 22 or 39(1))

If the applicant wishes to proceed with the international application in the national phase, he must, within 20 months or 30 months, or later in some Offices, perform the acts referred to therein before each designated or elected Office.

For further important information on the time limits and acts to be performed for entering the national phase, see the Annex to Form PCT/IB/301 (Notification of Receipt of Record Copy) and Volume II of the PCT Applicant's Guide.

Priority date (day/month/year)

07 October 1999 (07.10.99)

Applicant

VESTAS WIND SYSTEM A/S et al

1. The applicant is hereby informed that the International Bureau has, according to Article 31(7), notified each of the following Offices of its election:

∠EP :AT,BE,CH,CY,DE,DK,ES,FI,FR,GB,GR,IE,IT,LU,MC,NL,PT,SE National: AU,BG,CA,CN,CZ,DE,IL,JP,KP,KR,MN,NO,NZ,PL,RO,RU,SE,SK,US

2. The following Offices have waived the requirement for the notification of their election; the notification will be sent to them by the International Bureau only upon their request:

AP:GH,GM,KE,LS,MW,MZ,SD,SL,SZ,TZ,UG,ZW

EA:AM,AZ,BY,KG,KZ,MD,RU,TJ,TM

OA:BF,BJ,CF,CG,CI,CM,GA,GN,GW,ML,MR,NE,SN,TD,TG

National: AE, AG, AL, AM, AT, AZ, BA, BB, BR, BY, BZ, CH, CR, CU, DK, DM, DZ, EE, ES, FI, GB, GD,GE,GH,GM,HR,HU,ID,IN,IS,KE,KG,KZ,LC,LK,LR,LS,LT,LU,LV,MA,MD,MG,MK,MW,

MX,MZ,PT,SD,SG,SI,SL,TJ,TM,TR,TT,TZ,UA,UG,UZ,VN,YU,ZA,ZW

3. The applicant is reminded that he must enter the "national phase" before the expiration of 30 months from the priority date before each of the Offices listed above. This must be done by paying the national fee(s) and furnishing, if prescribed, a translation of the international application (Article 39(1)(a)), as well as, where applicable, by furnishing a translation of any annexes of the international preliminary examination report (Article 36(3)(b) and Rule 74.1).

Some offices have fixed time limits expiring later than the above-mentioned time limit. For detailed information about the applicable time limits and the acts to be performed upon entry into the national phase before a particular Office, see Volume II of the PCT Applicant's Guide.

The entry into the European regional phase is postponed until 31 months from the priority-date for all States designated for the purposes of obtaining a European patent.

EXAMINATION REPORT - SEPARATE SHEET

- 1.0 Reference is made to the following documents:
 - D1: WO 99 07996 A (ZOND ENERGY SYSTEMS INC) 18 February 1999 (1999-02-18)
 - D2: WO 92 14298 A (US WINDPOWER) 20 August 1992 (1992-08-20)
 - D3: EP-A-0 150 884 (TEMA SPA) 7 August 1985 (1985-08-07)
 - D4: US-A-4 906 060 (CLAUDE DAVID L) 6 March 1990 (1990-03-06)
 - D5: DE-A-196 20 906 (SIEMENS AG) 8 January 1998 (1998-01-08)
- 2.0 Independent claim 1 does not meet the requirements of Article 6 PCT in that the matter for which protection is sought is not clearly defined, the reasons being as follows:
- The expression "measures being taken so as to secure against possible variations in the speed of rotation" attempts to define the subject-matter in terms of the result to be achieved, which is not permissible in the present case (see PCT-Guidelines III-4.7). The analysis is done as if this expression would not be present in the claim.
- 2.2 Furthermore, it is not clear if the word "optionally" refers to the gear only or also to the transformer, which renders claim 1 unclear with regard to what extent protection is sought for. The analysis is based on the assumption that the word "optionally" refers to the gear only.
- 2.3 The wording "whereby the AC/DC rectifier is composed of diodes" has no limiting effect. For the analysis, it is understood that the claim is worded as: "whereby the AC/DC rectifier is composed of diodes only".
- 3.0 Prior art document D5, which is considered to represent the most relevant state of the art, discloses a wind power plant from which the subject-matter of independant claim 1 differs in that
 - a magnetic field controller is connected to the generator and is adapted to vary the magnetic field in the synchronous generator in response to a speed of rotation-depending output parameter of the generator in such a manner that possible variations in the speed of rotation are compensated for.
 - the AC/DC rectifier is composed of diodes only.

The objective problem to be solved may therefore be seen as to provide a

International application No. PCT/DK00/00558

variable speed wind power plant for the production of DC power in which the AC/DC rectifier is of simple construction.

The solution is achieved by the characterizing part of independent claim 1.

Document D5 discloses a wind power plant for the production of DC power with a speed regulation and does not disclose a magnetic field controller, nor an AC/DC rectifier made of diodes only.

Document D1 and D2 only disclose active AC/DC rectifiers, while document D3 and D4 are directed to the control of the output frequency and do not disclose a passive AC/DC rectifier.

None of the documents give an indication that would prompt the skilled person aware of document D5 to solve the problem as stated in claim 1.

Thus, the subject matter of claim 1 is considered to be new and to involve an inventive step in the sense of Articles 33(2) and 33(3) PCT.

- 4.0 Since they all are dependent on claim 1, the subject matter of the dependent claims 2 to 9 is also considered to be new and to involve an inventive step in the sense of Article 33(2) and Article 33(3) PCT.
- 5.0 The industrial applicability of the invention is self-evident.
- 6.0 Furthermore the following should be noted:
- 6.1 The expressions "relatively low inductance" and "relatively high speed of rotation" used in claims 6 and 7 have no well-recognised meaning and leave the reader in doubt as to the meaning of the technical features to which they refer, thereby rendering the definition of the subject-matter of said claims unclear (Article 6 PCT).
- 6.2 According to the requirements of Rule 11.13(m) PCT the same feature shall be denoted by the same reference sign throughout the application. This requirement is not met in view of the use of:
 - reference sign 7 in the description page 5 line 6
 - references IG1 and IG2 in claim 3 (See description page 5 line 27).

1

Title: Wind power plant

Technical Field:

The invention relates to a wind power plant where the driving shaft communicates with a synchronous generator optionally through a gear, and where a transformer with n output windings communicates with an HVDC-transmission cable through an AC/DC-rectifier, measures being taken so as to secure against possible variations in the speed of rotation.

The use of a DC transmission cable implies that it is not necessary to take into account the capacitive load generated by the cable. In addition, it is possible to make the HVDC transmission cables longer than the AC transmission cables. These AC transmission cables must not exceed a so-called "critical length".

Background Art

10

15

20

WO97/45908 discloses a wind power park where each wind turbine is equipped with a synchronous generator. The output power of the synchronous generator is rectified by means of an AC/DC rectifier and transmitted through a DC transmission cable to a DC/AC inverter and a transformer so as to be transferred to the regional supply network. The AC/DC rectifier comprises controlled rectifiers, which are able to compensate for possible variations in the speed of rotation through a suitable control by means of particular control circuits. However, such control circuits are rather complicated.

WO 92/14298 and WO 99/007996 disclose a variable speed wind turbine comprising active power converters for providing AC power. These power converters include active controlled rectifiers and require expensive controller circuits.

15

20

Brief Description of the Invention.

The object of the invention is to provide a wind turbine plant where each wind turbine is able to tolerate sudden gusts and is of a more simple construction than hitherto known.

A wind turbine plant of the above type is according to the invention characterised by a magnetic field controller connected to the generator, said magnetic field controller being adapted to vary the magnetic field in the synchronous generator in response to a speed of rotation-depending output parameter of said synchronous generator in such a manner that possible variations in the speed of rotation are compensated for, whereby the AC/DC rectifier is composed of diodes. As a result, passive rectifier elements suffice in the rectifier. In addition, the controllable rectifiers and the associated control circuits are avoided which should otherwise be used for compensating for possible variations in the speed of rotation.

Moreover according to the invention the magnetic field controller may be adapted to detect the current generated by the synchronous generator, a negative feedback being established by means of the magnetic field controller for regulating the current through the rotor winding.

In addition, the magnetic field controller may according to the invention be adapted to detect the voltage generated by the synchronous generator, a negative feedback being established by means of said magnetic field controller.

Moreover, the magnetic field controller may according to the invention be adapted to detect the power generated by the synchronous generator, a negative feedback being established by means of said magnetic field controller.

Claims

10

- 1. A wind power plant where the driving shaft communicates with a synchronous generator (3) optionally through a gear (2) and with a transformer with <u>n</u> output windings, said transformer communicating through an AC/DC rectifier with an HVDC transmission cable (9), measures being taken so as to secure against possible variations in the speed of rotation, c h a r a c t e r i s e d by a magnetic field controller (4) connected to the generator (3), said magnetic field controller (4) being adapted to vary the magnetic field in the synchronous generator (3) in response to a speed of rotation-depending output parameter of said generator (3) in such a manner that possible variations in the speed of rotation are compensated for, whereby the AC/DC rectifier is composed of diodes.
- 2. A wind power plant as claimed in claim 1, c h a r a c t e r i s e d in that the magnetic field controller (4) is adapted to detect the currents (IG1, IG2) generated by the synchronous generator (3), a negative feedback being established for regulating the current through the rotor winding (3a).
- 3. A wind power plant as claimed in claim 1, c h a r a c t e r i s e d in that the magnetic field controller (4) is adapted to detect the voltages (IG1, IG2) generated by the synchronous generator (3), a negative feedback being established for regulating the current through the rotor winding (3a).
- 4. A wind power plant as claimed in claim 1, c h a r a c t e r i s e d in that the magnetic field controller (4) is adapted to detect the power generated by the generator (3), a negative feedback being established for regulating the current through the rotor winding (3a) in response to the detected power.
- 5. A wind power plant as claimed in claim 4, c h a r a c t e r i s e d in that the negative feedback for regulating the current through the rotor windings (3a) includes a P, I or D regulation or a combination thereof.

- 6. A wind power plant as claimed in one or more of the preceding claims, c h a r a c t e r i s e d in that the rotor windings are dimensioned with a relatively low inductance.
- 7. A wind power plant as claimed in one or more of the preceding claims, c h a r a c t e r i s e d in that the rotor is adapted to rotate at a relatively high speed of rotation, whereby the inductance can be further reduced.
 - 8. A wind power plant as claimed in one or more of the preceding claims, c h a r a c t e r i s e d in that the synchronous generator (3) is multipolar.
- 9. A wind power plant as claimed in one or more of the preceding claims, where the wind turbine comprises a transformer with n output windings coupled in series with n rectifiers so as to obtain an HVDC.

European Patent Office International preliminary examining authority D-80298 Munich

PCT Chapter II

Dear Sirs

ੜ**ੇ** ਜੋ

International patent application No PCT/DK00/00558

Applicant: Vestas Wind System A/S, et al International patent clsssification: F 03 D 7/00

My ref: 72646 Si/Ve

Time limit: 13 October 2001

In response to the WRITTEN OPINION dated 13 August 2001, I hereby file a proposal for a new set of claims together with a new introduction to the specification in duplicate.

I further enclose a draft showing the amendments in handwriting.

The new claims 1 to 9 correspond substantially to the old claims 1 to 9.

WO 92/14298 (D2) discloses a variable speed wind turbine comprising active power converters for providing AC power. These power converters include active controlled rectifiers and require expensive controller circuits. The wind power system according to the invention is only adapted to provide DC power, and this has been obtained by means of converters consisting of diodes. Such diodes do not require expensive controller circuits. The wind power system according to the invention is therefore different from the wind power system according to **D2**. **D2** is therefore not anticipatory.

WO 99/07996 (D1) discloses a variable speed wind turbine system. The wind turbine system comprises a pitch controller and a torque controller, said controllers being adapted to operate

Chas.Hude

independently. Inverters (624, 630) (including active controlled rectifiers) require controller circuits. Such controller circuits have been omitted in the wind turbine system according to the invention. **D1** is therefore not anticipatory either.

US 4.906.060 (D4) discloses a wind turbine system comprising an apparatus for controlling the output frequency of an alternator by maintaining a relatively constant speed of rotation by increasing or decreasing the stator magnetic field. The magnetic field is controlled by means of a very complicated control circuit in the shape of a logic circuit (42) controlling an address decoder/driver (54) and D4 is therefore not anticipatory.

EP 0150884 (D3) discloses a wind turbine generator for providing a fixed frequency. In a first embodiment, the frequency is detected by means of a tachometer controlling the internal magnetic field in response thereto. In a second embodiment, the generator acts as a DC generator for providing DC, which by means of a converter is converted into AC of the frequency of the mains. None of these embodiments illustrate a converter in the shape of diodes and is therefore not anticipatory.

DE-OS 196 20 906 (D5) does not illustrate how it is possible to adapt a magnetic field controller to vary the magnetic fields in a synchronous generator in response to the speed of rotation and is therefore not anticipatory either.

Yours faithfully

CHAS, HUDE A/S

Demand received from IPEA on:					

- 1. The applicant is hereby notified that this International Preliminary Examining Authority transmits herewith the international preliminary examination report and its annexes, if any, established on the international application.
- A copy of the report and its annexes, if any, is being transmitted to the International Bureau for communication to all the elected Offices.
- 3. Where required by any of the elected Offices, the International Bureau will prepare an English translation of the report (but not of any annexes) and will transmit such translation to those Offices.

4. REMINDER

The applicant must enter the national phase before each elected Office by performing certain acts (filing translations and paying national fees) within 30 months from the priority date (or later in some Offices) (Article 39(1)) (see also the reminder sent by the International Bureau with Form PCT/IB/301).

Where a translation of the international application must be furnished to an elected Office, that translation must contain a translation of any annexes to the international preliminary examination report. It is the applicant's responsibility to prepare and furnish such translation directly to each elected Office concerned.

For further details on the applicable time limits and requirements of the elected Offices, see Volume II of the PCT Applicant's Guide.

VIII. Certain observations on the international application

The following observations on the clarity of the claims, description, and drawings or on the question whether the claims are fully supported by the description, are made: see separate sheet

- **EXAMINATION REPORT SEPARATE SHEET**
- 1.0 Reference is made to the following documents:
 - D1: WO 99 07996 A (ZOND ENERGY SYSTEMS INC) 18 February 1999 (1999-02-18)
 - WO 92 14298 A (US WINDPOWER) 20 August 1992 (1992-08-20) D2:
 - D3: EP-A-0 150 884 (TEMA SPA) 7 August 1985 (1985-08-07)
 - D4: US-A-4 906 060 (CLAUDE DAVID L) 6 March 1990 (1990-03-06)
 - D5: DE-A-196 20 906 (SIEMENS AG) 8 January 1998 (1998-01-08)
- Independent claim 1 does not meet the requirements of Article 6 PCT in that the matter for which protection is sought is not clearly defined, the reasons being as follows:
- 2.1 The expression "measures being taken so as to secure against possible variations in the speed of rotation" attempts to define the subject-matter in terms of the result to be achieved, which is not permissible in the present case (see PCT-Guidelines III-4.7). The analysis is done as if this expression would not be present in the claim.
- 2.2 Furthermore, it is not clear if the word "optionally" refers to the gear only or also to the transformer, which renders claim 1 unclear with regard to what extent protection is sought for. The analysis is based on the assumption that the word "optionally" refers to the gear only.
- 2.3 The wording "whereby the AC/DC rectifier is composed of diodes" has no limiting effect. For the analysis, it is understood that the claim is worded as: "whereby the AC/DC rectifier is composed of diodes only".
- 3.0 Prior art document D5, which is considered to represent the most relevant state of the art, discloses a wind power plant from which the subject-matter of independant claim 1 differs in that
 - a magnetic field controller is connected to the generator and is adapted to vary the magnetic field in the synchronous generator in response to a speed of rotation-depending output parameter of the generator in such a manner that possible variations in the speed of rotation are compensated for.
 - the AC/DC rectifier is composed of diodes only.

The objective problem to be solved may therefore be seen as to provide a

EXAMINATION REPORT - SEPARATE SHEET

variable speed wind power plant for the production of DC power in which the AC/DC rectifier is of simple construction.

The solution is achieved by the characterizing part of independent claim 1.

Document D5 discloses a wind power plant for the production of DC power with a speed regulation and does not disclose a magnetic field controller, nor an AC/DC rectifier made of diodes only.

Document D1 and D2 only disclose active AC/DC rectifiers, while document D3 and D4 are directed to the control of the output frequency and do not disclose a passive AC/DC rectifier.

None of the documents give an indication that would prompt the skilled person aware of document D5 to solve the problem as stated in claim 1.

Thus, the subject matter of claim 1 is considered to be new and to involve an inventive step in the sense of Articles 33(2) and 33(3) PCT.

- 4.0 Since they all are dependent on claim 1, the subject matter of the dependent claims 2 to 9 is also considered to be new and to involve an inventive step in the sense of Article 33(2) and Article 33(3) PCT.
- 5.0 The industrial applicability of the invention is self-evident.
- 6.0 Furthermore the following should be noted:
- 6.1 The expressions "relatively low inductance" and "relatively high speed of rotation" used in claims 6 and 7 have no well-recognised meaning and leave the reader in doubt as to the meaning of the technical features to which they refer, thereby rendering the definition of the subject-matter of said claims unclear (Article 6 PCT).
- 6.2 According to the requirements of Rule 11.13(m) PCT the same feature shall be denoted by the same reference sign throughout the application. This requirement is not met in view of the use of:
 - reference sign 7 in the description page 5 line 6
 - references IG1 and IG2 in claim 3 (See description page 5 line 27).

20

1

Title: Wind power plant

Technical Field:

The invention relates to a wind power plant where the driving shaft communicates with a synchronous generator optionally through a gear, and where a transformer with n output windings communicates with an HVDC-transmission cable through an AC/DC-rectifier, measures being taken so as to secure against possible variations in the speed of rotation.

The use of a DC transmission cable implies that it is not necessary to take into account the capacitive load generated by the cable. In addition, it is possible to make the HVDC transmission cables longer than the AC transmission cables. These AC transmission cables must not exceed a so-called "critical length".

Background Art

WO97/45908 discloses a wind power park where each wind turbine is equipped with a synchronous generator. The output power of the synchronous generator is rectified by means of an AC/DC rectifier and transmitted through a DC transmission cable to a DC/AC inverter and a transformer so as to be transferred to the regional supply network. The AC/DC rectifier comprises controlled rectifiers, which are able to compensate for possible variations in the speed of rotation through a suitable control by means of particular control circuits. However, such control circuits are rather complicated.

WO 92/14298 and WO 99/007996 disclose a variable speed wind turbine comprising active power converters for providing AC power. These power converters include active controlled rectifiers and require expensive controller circuits.

Brief Description of the Invention.

The object of the invention is to provide a wind turbine plant where each wind turbine is able to tolerate sudden gusts and is of a more simple construction than hitherto known.

A wind turbine plant of the above type is according to the invention characterised by a magnetic field controller connected to the generator, said magnetic field controller being adapted to vary the magnetic field in the synchronous generator in response to a speed of rotation-depending output parameter of said synchronous generator in such a manner that possible variations in the speed of rotation are compensated for, where-by the AC/DC rectifier is composed of diodes. As a result, passive rectifier elements suffice in the rectifier. In addition, the controllable rectifiers and the associated control circuits are avoided which should otherwise be used for compensating for possible variations in the speed of rotation.

Moreover according to the invention the magnetic field controller may be adapted to detect the current generated by the synchronous generator, a negative feedback being established by means of the magnetic field controller for regulating the current through the rotor winding.

In addition, the magnetic field controller may according to the invention be adapted to detect the voltage generated by the synchronous generator, a negative feedback being established by means of said magnetic field controller.

Moreover, the magnetic field controller may according to the invention be adapted to detect the power generated by the synchronous generator, a negative feedback being established by means of said magnetic field controller.

Claims

10

15

- 1. A wind power plant where the driving shaft communicates with a synchronous generator (3) optionally through a gear (2) and with a transformer with <u>n</u> output windings, said transformer communicating through an AC/DC rectifier with an HVDC transmission cable (9), measures being taken so as to secure against possible variations in the speed of rotation, c h a r a c t e r i s e d by a magnetic field controller (4) connected to the generator (3), said magnetic field controller (4) being adapted to vary the magnetic field in the synchronous generator (3) in response to a speed of rotation-depending output parameter of said generator (3) in such a manner that possible variations in the speed of rotation are compensated for, whereby the AC/DC rectifier is composed of diodes.
- 2. A wind power plant as claimed in claim 1, c h a r a c t e r i s e d in that the magnetic field controller (4) is adapted to detect the currents (IG1, IG2) generated by the synchronous generator (3), a negative feedback being established for regulating the current through the rotor winding (3a).
- 3. A wind power plant as claimed in claim 1, c h a r a c t e r i s e d in that the magnetic field controller (4) is adapted to detect the voltages (IG1, IG2) generated by the synchronous generator (3), a negative feedback being established for regulating the current through the rotor winding (3a).
- 4. A wind power plant as claimed in claim 1, c h a r a c t e r i s e d in that the magnetic field controller (4) is adapted to detect the power generated by the generator (3), a negative feedback being established for regulating the current through the rotor winding (3a) in response to the detected power.
- 5. A wind power plant as claimed in claim 4, c h a r a c t e r i s e d in that the negative feedback for regulating the current through the rotor windings (3a) includes a P, I or D regulation or a combination thereof.

8

- 6. A wind power plant as claimed in one or more of the preceding claims, c h a r a c t e r i s e d in that the rotor windings are dimensioned with a relatively low inductance.
- 7. A wind power plant as claimed in one or more of the preceding claims, c h a r a c t e r i s e d in that the rotor is adapted to rotate at a relatively high speed of rotation, whereby the inductance can be further reduced.
 - 8. A wind power plant as claimed in one or more of the preceding claims, c h a r a c t e r i s e d in that the synchronous generator (3) is multipolar.
- 9. A wind power plant as claimed in one or more of the preceding claims, where the wind turbine comprises a transformer with n output windings coupled in series with n rectifiers so as to obtain an HVDC.

Title: Wind power plant

Technical Field

DRAFT Oct. 2001

The invention relates to a wind power plant where the driving shaft communicates with a synchronous generator optionally through a gear, and where a transformer, with an HVDC-transmission cable through an AC/DC-rectifier, measures being taken so as to secure against possible variations in the speed of rotation.

Background Art

The use of a DC transmission cable implies that it is not necessary to take into account the capacitive load generated by the cable. In addition, it is possible to make
the HVDC transmission cables longer than the AC transmission cables. These AC
transmission cables must not exceed a so-called "critical length".

Background Art

WO97/45908 discloses a wind power park where each wind turbine is equipped with a synchronous generator. The output power of the synchronous generator is rectified by means of an AC/DC rectifier and earried through a DC transmission cable to a DC/AC inverter and a transformer so as to be transferred to the regional supply network. Means are provided for regulating the power. This known wind power site is encumbered with the draw-back that it cannot to a sufficient extent compensate for sudden, strong gusts, and it is not equipped with an HVDC output by means of a transformer with several output windings.

In addition, the AC/DC rectifier comprises controlled rectifiers, which are able to compensate for possible variations in the speed of rotation through a suitable control by means of particular control circuits. However, such control circuits are rather complicated.

(A) Brul disclosure of 10 92/14298

Brief Description of the Invention.

The object of the invention is to provide a wind turbine plant where each wind turbine each tolerate sudden gusts to a far higher extent than previously known, and where each wind turbine is of a far more simple structure than hitherto known.

- that it comprises a magnetic field controller connected to the synchronous generator, said magnetic field controller being adapted to vary the magnetic field in the synchronous generator in response to an output parameter of said synchronous generator in such a manner that possible variations in the speed of rotation are compensated for, whereby a possible increase of the speed of rotation causes a reduction of the magnet ic field in the synchronous generator. As a result, passive rectifier elements suffice in the rectifier. In addition, the controllable rectifiers and the associated control circuits are avoided which should otherwise be used for compensating for possible variations in the speed of rotation.
- Moreover according to the invention the magnetic field controller may be adapted to detect the current generated by the synchronous generator, a negative feedback being established by means of the magnetic field controller for regulating the current through the rotor winding.
- In addition, the magnetic field controller may according to the invention be adapted to detect the voltage generated by the synchronous generator, a negative feedback being established by means of said magnetic field controller.

Moreover, the magnetic field controller may according to the invention be adapted to detect the power generated by the synchronous generator, a negative feedback being established by means of said magnetic field controller.

Claims

5

25

1. A wind power plant where the driving shaft communicates with a synchronous generator (3) optionally through a gear (2) and with a transformer (if any) with n output windings, said transformer communicating through an AC/DC rectifier with an HVDC transmission cable (9), measures being taken so as to secure against possible variations in the speed of rotation, c h a r a c t e r i s e d by a magnetic field controller (4) connected to the generator (3), said magnetic field controller (4) being adapted to vary the magnetic field in the synchronous generator (3) in response to a speed of rotation-depending output parameter of said generator (3) in such a manner that possible variations in the speed of rotation are compensated for. where by the AC/DC rectified

2. A wind power plant as claimed in claim 1, c h a r a c t e r i s e d in that the magnetic field controller (4) is adapted to detect the currents (IG1, IG2) generated by the synchronous generator (3), a negative feedback being established for regulating the current through the rotor winding (3<u>a</u>).

- 3. A wind power plant as claimed in claim 1, c h a r a c t e r i s e d in that the magnetic field controller (4) is adapted to detect the voltages (IG1, IG2) generated by the synchronous generator (3), a negative feedback being established for regulating the current through the rotor winding (3a).
- 4. A wind power plant as claimed in claim 1, c h a r a c t e r i s e d in that the
 20 magnetic field controller (4) is adapted to detect the power generated by the generator (3), a negative feedback being established for regulating the current through the rotor winding (3a) in response to the detected power.
 - 5. A wind power plant as claimed in claim 4, c h a r a c t e r i s e d in that the negative feedback for regulating the current through the rotor windings (3<u>a</u>) includes a P, I or D regulation or a combination thereof.

Title: Wind power plant

Technical Field

The invention relates to a wind power plant where the driving shaft communicates with a synchronous generator optionally through a gear, and where a transformer, if any, communicates with an HVDC-transmission cable through an AC/DC-rectifier, measures being taken so as to secure against possible variations in the speed of rotation.

Background Art

10

20

The use of a DC transmission cable implies that it is not necessary to take into account the capacitive load generated by the cable. In addition, it is possible to make the HVDC transmission cables longer than the AC transmission cables. These AC transmission cables must not exceed a so-called "critical length".

WO97/45908 discloses a wind power park where each wind turbine is equipped with a synchronous generator. The output power of the synchronous generator is rectified by means of an AC/DC rectifier and carried through a DC transmission cable to a DC/AC inverter and a transformer so as to be transferred to the regional supply network. Means are provided for regulating the power. This known wind power site is encumbered with the draw-back that it cannot to a sufficient extent compensate for sudden, strong gusts, and it is not equipped with an HVDC output by means of a transformer with several output windings.

In addition, the AC/DC rectifier comprises controlled rectifiers, which are able to compensate for possible variations in the speed of rotation through a suitable control by means of particular control circuits. However, such control circuits are rather complicated.

Brief Description of the Invention.

The object of the invention is to provide a wind turbine plant where each wind turbine can tolerate sudden gusts to a far higher extent than previously known, and where each wind turbine is of a far more simple structure than hitherto known.

- A wind turbine plant of the above type is according to the invention characterised in that it comprises a magnetic field controller connected to the synchronous generator, said magnetic field controller being adapted to vary the magnetic field in the synchronous generator in response to an output parameter of said synchronous generator in such a manner that possible variations in the speed of rotation are compensated for, whereby a possible increase of the speed of rotation causes a reduction of the magnetic field in the synchronous generator. As a result, passive rectifier elements suffice in the rectifier. In addition, the controllable rectifiers and the associated control circuits are avoided which should otherwise be used for compensating for possible variations in the speed of rotation.
- Moreover according to the invention the magnetic field controller may be adapted to detect the current generated by the synchronous generator, a negative feedback being established by means of the magnetic field controller for regulating the current through the rotor winding.

In addition, the magnetic field controller may according to the invention be adapted to detect the voltage generated by the synchronous generator, a negative feedback being established by means of said magnetic field controller.

Moreover, the magnetic field controller may according to the invention be adapted to detect the power generated by the synchronous generator, a negative feedback being established by means of said magnetic field controller.

<u>Claims</u>

- 1. A wind power plant where the driving shaft communicates with a synchronous generator (3) optionally through a gear (2) and with a transformer, if any, with <u>n</u> output windings, said transformer communicating through an AC/DC rectifier with an HVDC transmission cable (9), measures being taken so as to secure against possible variations in the speed of rotation, c h a r a c t e r i s e d by a magnetic field controller (4) connected to the generator (3), said magnetic field controller (4) being adapted to vary the magnetic field in the synchronous generator (3) in response to a speed of rotation-depending output parameter of said generator (3) in such a manner that possible variations in the speed of rotation are compensated for.
- 2. A wind power plant as claimed in claim 1, c h a r a c t e r i s e d in that the magnetic field controller (4) is adapted to detect the currents (IG1, IG2) generated by the synchronous generator (3), a negative feedback being established for regulating the current through the rotor winding (3a).
- 3. A wind power plant as claimed in claim 1, c h a r a c t e r i s e d in that the magnetic field controller (4) is adapted to detect the voltages (IG1, IG2) generated by the synchronous generator (3), a negative feedback being established for regulating the current through the rotor winding (3<u>a</u>).
- 4. A wind power plant as claimed in claim 1, c h a r a c t e r i s e d in that the
 20 magnetic field controller (4) is adapted to detect the power generated by the generator
 (3), a negative feedback being established for regulating the current through the rotor winding (3a) in response to the detected power.
 - 5. A wind power plant as claimed in claim 4, c h a r a c t e r i s e d in that the negative feedback for regulating the current through the rotor windings (3a) includes
- 25 a P, I or D regulation or a combination thereof.

- 6. A wind power plant as claimed in one or more of the preceding claims, c h a r a c t e r i s e d in that the rotor windings are dimensioned with a relatively low inductance.
- 7. A wind power plant as claimed in one or more of the preceding claims, c h a r a c t e r i s e d in that the rotor is adapted to rotate at a relatively high speed of rotation, whereby the inductance can be further reduced.
 - 8. A wind power plant as claimed in one or more of the preceding claims, c h a r a c t e r i s e d in that the synchronous generator (3) is multipolar.
- 9. A wind power plant as claimed in one or more of the preceding claims, where the wind turbine comprises a transformer with <u>n</u> output windings coupled in series with n rectifiers so as to obtain an HVDC.

(54) Title: WIND POWER PLANT

(57) Abstract: A wind power plant where the driving shaft communicates with a synchronous generator (3) optionally through a gear (2) and with a transformer, if any, communicating through an AC/DC inverter 7 with an HVDC transmission cable 9. The synchronous generator (3) is connected to a magnetic field controller (3). In response to an output parameter, such as the power generated by the synchronous generator (3), this magnetic field controller (4) is adapted to vary the magnetic field in the generator (3) in response to said output parameter. As a result it is possible to compensate for a possible variation in the output parameter, whereby said output parameter is stabilized. As a result it is possible to compensate for a varying speed of rotation.

Title: Wind power plant

Technical Field

The invention relates to a wind power plant where the driving shaft communicates with a synchronous generator optionally through a gear, and where a transformer, if any, communicates with an HVDC-transmission cable through an AC/DC-rectifier, measures being taken so as to secure against possible variations in the speed of rotation.

Background Art

15

20

The use of a DC transmission cable implies that it is not necessary to take into account the capacitive load generated by the cable. In addition, it is possible to make
the HVDC transmission cables longer than the AC transmission cables. These AC
transmission cables must not exceed a so-called "critical length".

WO97/45908 discloses a wind power park where each wind turbine is equipped with a synchronous generator. The output power of the synchronous generator is rectified by means of an AC/DC rectifier and carried through a DC transmission cable to a DC/AC inverter and a transformer so as to be transferred to the regional supply network. Means are provided for regulating the power. This known wind power site is encumbered with the draw-back that it cannot to a sufficient extent compensate for sudden, strong gusts, and it is not equipped with an HVDC output by means of a transformer with several output windings.

In addition, the AC/DC rectifier comprises controlled rectifiers, which are able to compensate for possible variations in the speed of rotation through a suitable control by means of particular control circuits. However, such control circuits are rather complicated.

Brief Description of the Invention.

The object of the invention is to provide a wind turbine plant where each wind turbine can tolerate sudden gusts to a far higher extent than previously known, and where each wind turbine is of a far more simple structure than hitherto known.

- A wind turbine plant of the above type is according to the invention characterised in that it comprises a magnetic field controller connected to the synchronous generator, said magnetic field controller being adapted to vary the magnetic field in the synchronous generator in response to an output parameter of said synchronous generator in such a manner that possible variations in the speed of rotation are compensated for, whereby a possible increase of the speed of rotation causes a reduction of the magnetic field in the synchronous generator. As a result, passive rectifier elements suffice in the rectifier. In addition, the controllable rectifiers and the associated control circuits are avoided which should otherwise be used for compensating for possible variations in the speed of rotation.
- 15 Moreover according to the invention the magnetic field controller may be adapted to detect the current generated by the synchronous generator, a negative feedback being established by means of the magnetic field controller for regulating the current through the rotor winding.

In addition, the magnetic field controller may according to the invention be adapted to detect the voltage generated by the synchronous generator, a negative feedback being established by means of said magnetic field controller.

Moreover, the magnetic field controller may according to the invention be adapted to detect the power generated by the synchronous generator, a negative feedback being established by means of said magnetic field controller.

Furthermore, the negative feedback may according to the invention include a P, I or D regulation, optionally a combination of said regulations.

Moreover, the rotor of the synchronous generator may according to the invention be dimensioned with a relatively low inductance. As a result, the time constant of the magnetic field controller can be reduced.

Moreover, the rotor may according to the invention be adapted to rotate at a relatively high speed of rotation. As a result it is possible to further reduce the inductance of said rotor.

When the generator furthermore is multipolar, it is possible to further reduce the inductance of the rotor.

Brief Description of the Drawings

The invention is explained in greater detail below with reference to the accompanying drawings, in which

- 15 Fig. 1 shows a wind power plant according to the invention comprising a synchronous generator and an AC/DC rectifier,
 - Fig. 2 illustrates a magnetic field controller for the synchronous generator of Fig. 1,
 - Fig. 3 shows a transformer connected to the synchronous generator,
- Fig. 4 illustrates the entire plant, where the AC/DC rectifier has been shown in greater detail, and
 - Fig. 5 shows the voltage versus the speed of rotation at various magnetizing currents

to the synchronous generator.

Best Mode for Carrying Out the Invention

The wind power plant shown in Fig. 1 comprises a number of arms 1 secured to a hub communicating with a synchronous generator 3, optionally through a gear 2. The synchronous generator 3 is preferably a conventional three-phase synchronous generator with an energy supply to the rotor winding not involving a collector ring. The three-phase output of the synchronous generator 3 communicates with an AC/DC rectifier 7 through a possibly three-phase transformer 5. The AC/DC rectifier 7 delivers a DC voltage to a DC transmission cable 9. The most simple embodiment of the high-voltage rectifier 7 is formed by ordinary diodes coupled in series, and accordingly it is a passive rectifier. The series coupling of the diodes is established by means of several output windings on the output of the transformer 5. In this manner the voltage is reduced to all the diodes, and the harmonic flows in the generator/transformer are reduced. The three-phase transformer 5 can be designed as indicated in Fig. 3, where the primary side is connected to the generator output and comprises a star connection, and the secondary side is connected to the AC/DC rectifier 7 and can be composed of a Δ -connection and two combined Δ -star connections. The voltages generated by the secondary side of the transformer 5 are transferred to an AC/DC rectifier in form of a so-called B6 diode bridge, cf. Fig. 4. This B6 diode bridge comprises a total of eighteen rectifier elements, viz. six on each secondary winding, where each of the three phase conductors of each secondary winding is connected to the connection point of two rectifier elements coupled in the same direction, said three pairs of rectifier elements being coupled in parallel. The parallel coupling of the rectifier elements associated with each of the three secondary windings is subsequently coupled in series with the result that an HVDC-voltage is transmitted from the combined coupling of rectifier elements to an HVDC transmission cable 9. This transmission cable 9 can be several km long, such as 10 km. The use of such a DC transmission cable 9 instead of an AC cable is advantageous in the

WO 01/25628 PCT/DK00/00558

5

length being arbitrary and almost unlimited. Thus it is not a question of a critical length as in connection with an AC cable. The end of the DC transmission cable 9 can be connected to a conventional DC/AC inverter converting into a mains frequency and be connected to the regional supply network optionally through a three-phase transformer. Measures have, of course, been taken to ensure that the alternating voltage generated by the DC/AC inverter 7 is in phase with the regional supply network.

5

15

20

A demand exists, of course, for a possibility of running the wind power plant at a speed of rotation depending on the wind speed. However, an increase of the speed of rotation implies that a high voltage is generated because the voltage is proportional to the speed of rotation, cf. the curves of Fig. 5. However, the output voltage is also proportional to the magnetic field in the generator 3, which can be utilized for stabilizing the voltage in case the speed of rotation is changed. The latter has according to the invention been obtained by means of a magnetic field controller 4 detecting an output parameter of the generator 3, such as the current and the voltage or the product thereof. This magnetic field controller 4 regulates the current supply to the rotor windings in the generator in response to the output parameter. As a result, a negative feedback is established with the result that when the output power is increased the current supply to the rotor winding 3a is reduced, whereby the system automatically seeks equilibrium. When the speed of rotation for instance is increased to 130% relative to an ordinary speed of rotation, the magnetizing current to the rotor winding 3a is reduced to 80%, cf. Fig. 5. When, on the contrary, the speed of rotation decreases to 80% relative to the ordinary speed of rotation, the magnetizing current to the rotor winding 3a is increased to 130%.

25 Fig. 2 shows an embodiment in greater detail of the magnetic field controller 4, and it appears that in two of the three phases of the generator the currents IG1, IG2 and the voltages UG1, UG2, respectively, are detected. These parameter values are multiplied in pairs to obtain an expression of the output power P_{gen}. This output

20

25

power P_{gen} is compared with a reference value P_{ref} , and the difference therebetween, viz. the error signal, is transferred to a regulation unit 11. In response to this error signal, the regulation unit generates a value for the magnetizing current I_m which is to be transferred to the rotor winding, optionally through a PWM 12 (Pulse Width Modulator) and an amplifying power transistor 13 controlling the supply of current to the rotor winding. The negative feedback is established by the detected power P_{gen} being deducted from the reference power P_{ref} . As a result a detected increased power P_{gen} implies that the error signal is reduced and that the power supplied to the rotor windings is reduced as well.

10 The power for the magnetizing of the generator 3 is typically of the magnitude 1% of the nominal power of the generator.

A portion of the magnetizing can optionally be provided by means of permanent magnets, where an electric magnetizing is then used for controlling the speed of rotation. The speed of rotation is downwardly limited by a maximum magnetizing current due to the limited thermal properties of the rotor windings and the magnetic structure of the generator, viz. the magnetic saturation. In order to extend the lower limit of the speed of rotation it is therefore advantageous when either the generator is provided with an additional output presenting an increased nominal output voltage or the transformer is provided with an input presenting a reduced nominal voltage. These additional inputs are only to be dimensioned for low power as the wind energy is low at a low speed of rotation.

According to a particularly advantageous embodiment, the wind turbine comprises a transformer with \underline{n} output windings coupled in series with rectifiers so as to obtain an HVDC. The output windings can be coupled as a star or a Δ or as a combination thereof in order to obtain a sinusoidal input current.

Claims

- 1. A wind power plant where the driving shaft communicates with a synchronous generator (3) optionally through a gear (2) and with a transformer, if any, with <u>n</u> output windings, said transformer communicating through an AC/DC rectifier with an HVDC transmission cable (9), measures being taken so as to secure against possible variations in the speed of rotation, c h a r a c t e r i s e d by a magnetic field controller (4) connected to the generator (3), said magnetic field controller (4) being adapted to vary the magnetic field in the synchronous generator (3) in response to a speed of rotation-depending output parameter of said generator (3) in such a manner that possible variations in the speed of rotation are compensated for.
 - 2. A wind power plant as claimed in claim 1, c h a r a c t e r i s e d in that the magnetic field controller (4) is adapted to detect the currents (IG1, IG2) generated by the synchronous generator (3), a negative feedback being established for regulating the current through the rotor winding (3<u>a</u>).
- 3. A wind power plant as claimed in claim 1, c h a r a c t e r i s e d in that the magnetic field controller (4) is adapted to detect the voltages (IG1, IG2) generated by the synchronous generator (3), a negative feedback being established for regulating the current through the rotor winding (3a).
- 4. A wind power plant as claimed in claim 1, c h a r a c t e r i s e d in that the
 20 magnetic field controller (4) is adapted to detect the power generated by the generator
 (3), a negative feedback being established for regulating the current through the rotor winding (3a) in response to the detected power.
 - 5. A wind power plant as claimed in claim 4, c h a r a c t e r i s e d in that the negative feedback for regulating the current through the rotor windings (3a) includes
- 25 a P, I or D regulation or a combination thereof.

- 6. A wind power plant as claimed in one or more of the preceding claims, c h a r a c t e r i s e d in that the rotor windings are dimensioned with a relatively low inductance.
- 7. A wind power plant as claimed in one or more of the preceding claims, c h a r a c t e r i s e d in that the rotor is adapted to rotate at a relatively high speed of rotation, whereby the inductance can be further reduced.
 - 8. A wind power plant as claimed in one or more of the preceding claims, c h a r a c t e r i s e d in that the synchronous generator (3) is multipolar.
- 9. A wind power plant as claimed in one or more of the preceding claims, where the wind turbine comprises a transformer with <u>n</u> output windings coupled in series with n rectifiers so as to obtain an HVDC.
